Chapter 1. Developing Acoustic Materials from Polymeric Waste and the Manufacturing Issues 1

1.1 Introduction.....	1
1.2 Aim and Objectives of the study	2
1.3 Structure of this thesis	4

Chapter 2. Literature Review 5

2.1 The sustainability issue.....	5
2.2 Acoustic material markets and some indication of the costs	6
2.3 Acoustic materials	9
2.4 Resources used for making vibro-acoustic and thermal insulation materials	11
2.5 Manufacturing methods	13

2.6	Chemical methods for recycling polymeric waste	17
2.7	Wave propagation through porous media	21
2.8	Classification of porous materials	23
2.9	Fundamentals of sound propagation through porous materials	26
2.10	Modelling acoustic wave propagation through elastic porous media	30
2.11	Tailoring of Acoustic Materials from Waste	35
2.12	Processing consideration	36
2.13	Summary	38
 Chapter 3. Material Manufacturing Process.....		39
3.1	Introduction.....	39
3.2	The batch process	39
3.3	The cold extrusion process	40
3.4	The novel cold extrusion technology	41
3.5	Extruder scale up – The initial design	48
3.6	Modifications made to the initial design	55
3.7	The chemical process for making the porous materials	66
3.8	The chemical reactions occurring in the cold extrusion process	69
3.9	Rate of reaction of 4,4 dipheylmethane diisocyanate with water	79
3.10	Pore size distribution of the extruded samples	84
3.11	Fume analysis test of the extruded samples	89

3.12 Two level factorial design used for the exploration of the cold extrusion process	92
3.13 Summary	95

Chapter 4. Acoustical Properties of Porous Media and

Characterisation Methods.....96

4.1 Introduction.....	96
4.2 Comparison of modeling approaches for highly heterogeneous porous media	97
4.3 Arbitrary pore size distribution approach	98
4.4 Double porosity approach	100
4.5 Pade approximation	103
4.6 Johnson-Champuex Allard Model	107
4.7 Characterisation methods for acoustic materials	108
4.8 Large and small impedance tube	108
4.9 Impact sound insulation test	117
4.10 Measurement of some related non-acoustic material properties	120
4.11 Porosity measurement	121
4.12 Flow resistivity	124
4.13 Dynamic stiffness	128
4.14 Tortuosity	132
4.15 Thermal conductivity	138
4.16 Rate of reaction of binder with water	140

4.17 Determination of the accuracy of the acoustic instruments(round robin test)	144
4.18 Summary	159
Chapter 5. Experimental Results.....	160
5.1 Introduction.....	160
5.2 Waste used in the experimental trials	160
5.3 Calibration of the extruder	162
5.4 Influence of extruder variables on the performance of materials	169
5.5 Influence of extruder variables on sound absorption	178
5.6 Experiments using the larger modified extruder	183
5.7 Acoustic characterisation of the porous materials	187
5.8 Summary	200
Chapter 6. Comparison of Modelling Approaches	201
6.1 Introduction	201
6.2 Pade Approximation Approach	202
6.3 Johnson-Champoux-Allard Approach	208
6.4 Summary	213
Chapter 7. Auxiliary Properties of the Developed Porous Products .	215
7.1 Introduction.....	215
7.2 Formulations for the optimum products developed	215

7.3	Trials at RAPRA using the rubber extruder	229
7.4	Sustainable acoustic material cost analysis model	235
Chapter 8. Conclusions and Recommendations.....		238
8.1	Conclusions.....	238
8.2	Recommendations for further work.....	239
