

ABSTRACT

Drug trafficking and smuggling is an ongoing challenge for law enforcement agencies. Cocaine smuggling is a high-value pursuit for smugglers and has been attempted using a variety of concealment methods including the use of bottled liquids, canned milk, wax and suspensions in cans of beer. In particular, traffickers have used clothing impregnated with cocaine for smuggling. Handling, transportation or re-packaging of drugs of abuse and explosives will inevitably leave residual material on the clothing and other possessions of the involved persons. The nails and skin of the person may also be contaminated through the handling of these substances.

This research study describes the development of Raman spectroscopic techniques for the detection of drugs of abuse and explosives on biomaterials of forensic relevance including undyed natural and synthetic fibres and dyed textile specimens, nail and skin. Confocal Raman microscopy has been developed and evaluated for the detection and identification of particulates of several drugs of abuse and explosives on different substrates. The results show that excellent spectroscopic discrimination can be achieved between single particles and substrate materials, giving a ubiquitous non-destructive approach to the analysis of pico-gram quantities of the drugs and explosives *in-situ*. Isolating the particle in this way corresponds with an analytical sensitivity comparable with the most sensitive analytical techniques currently available *e.g.* the highly sensitive, yet destructive ionization desorption mass spectrometry. With the confocal Raman approach, this work demonstrates that definitive molecular-specific information can be achieved within seconds without significant interference from the substrate. The potential for the application of this technique as a rapid preliminary, forensic screening procedure is obvious and attractive to non-specialist operators as it does not involve prior chemical pretreatment

or detachment of the analyte from the substrate. As a result, evidential materials can be analysed without compromising their integrity for future investigation.

Also, the applications of benchtop and portable Raman spectroscopy for the *in-situ* detection of drugs of abuse in clothing impregnated with the drugs have been demonstrated. Raman spectra were obtained from a set of undyed natural and synthetic fibres and dyed textiles impregnated with these drugs. The spectra were collected using three Raman spectrometers; one benchtop dispersive spectrometer coupled to a fibre-optic probe and two portable spectrometers. High quality spectra of the drugs could be acquired *in-situ* within seconds and without any sample preparation or alteration of the evidential material. A field-portable Raman spectrometer is a reliable instrument that can be used by emergency response teams to rapidly identify unknown samples. This method lends itself well to further development for the *in-situ* examination by law enforcement officers of items associated with users, handlers and suppliers of drugs of abuse in the forensics arena.

In the last section of this study, a portable prototype Raman spectrometer (DeltaNu Advantage 1064) equipped with 1064 nm laser excitation has been evaluated for the analysis of drugs of abuse and explosives. The feasibility of the instrument for the analysis of the samples both as neat materials and whilst contained in plastic and glass containers has been investigated. The advantages, disadvantages and the analytical potential in the forensics arena of this instrument have been discussed.

Key words: Raman spectroscopy; drugs of abuse; explosives; forensics.

ACKNOWLEDGEMENT

Without the support, patience and guidance of the following people, this study would not have been completed. It is to them that I owe my deepest gratitude.

First of all, I am heartily thankful to my supervisor, Howell G.M. Edwards, whose encouragement, guidance and support from the initial to the final level enabled me to develop an understanding of the subject. Howell was always there to listen, to give advice, to meet and talk about my ideas and to proofread and mark up my papers and chapters. This thesis would not have been possible without his help and guidance. His wisdom, knowledge and commitment to the highest standards inspired and motivated me.

Also, I would like to thank my supervisor, Dr Ian J. Scowen for the valuable guidance and advice despite his many other academic and professional commitments. His willingness to motivate me contributed tremendously to my research project.

I would like to thank the Egyptian Government and Sohag University for providing me the PhD scholarship. I owe my deepest gratitude to all members of the Egyptian Educational and Cultural Bureau, Egyptian Embassy in London for sponsoring me on this course.

I would like to thank Dennis Farwell for his kind assistance and technical support. I would like to express my thanks to my friend Michael Hargreaves for his cooperation and support.

Above all, I would like to thank my wife Israa Omar for her personal support and great patience at all times, my beloved mother, brothers and sisters for their endless love and care.
