# Pharmaceutical Supply Chains and Management Innovation?

## Abstract

**Purpose:** This research evaluates the implementation of innovative programmes within the downstream domain of the Pharmaceutical Supply Chain (PSC) with the aim of informing improved service provision.

**Design/methodology/approach:** A mixed-method approach was used to assess to what extent innovation could be adopted by hospital and community pharmacies to improve the delivery process of pharmaceutical products. Unstructured interviews and 130 questionnaires were collected and analysed to identify factors that support or prevent innovation within PSC processes.

**Findings:** The analysis led to the generation of the Innovative Pharmaceutical Supply Chain Framework (IPSCF) that provides guidance to healthcare organisations about how SCM problems could be addressed by implementing innovative approaches. The results also indicated that the implementation of Lean and Reverse Logistics practices, supported by integrated Information Technology (IT) systems, could help healthcare organisations to enhance their delivery in terms of quality (products and service quality), visibility (knowledge and information sharing), speed (response to customers and suppliers needs) and cost (minimisation of cost and waste).

**Practical implications:** The study's recommendations have potential implications for supply chain theory and practice and particularly for pharmacies in terms of innovation adoption. The IPSCF provides guidance to pharmacies and healthcare organisations to develop more efficient and effective supply chain strategies.

**Originality/value:** This research contributes to academic literature as it adds novel theoretical insights to highly complex delivery process innovation.

## 1. Introduction

Pharmacies are a key link between healthcare services and patients, as they are responsible for dispensing and managing pharmaceuticals and offering value added services to prolong life (Edwards *et al.*, 2018). Considering healthcare organisations' crucial role in supporting patient care, investments and constant improvement are required for the healthcare system to operate efficiently and satisfy the increased demand for high quality services (Sayed *et al.*, 2018). However, they face the challenge of minimising the cost of healthcare services while sustaining or enhancing the level of quality they provide (Narayanamurthy *et al.*, 2018; Papalexi *et al.*, 2020). Data presented by Statista (Mikulic, 2019) suggests that worldwide drug expenditure will continue to grow and as of 2018 approximately \$1.2 trillion will have been spent on medicines with an expected increase to \$1.52 trillion by 2023. Furthermore, the global medical waste is estimated to be \$13.3 billion in 2020 (Markets and Markets Research, 2018), which includes the perceived high level of wastage associated

with pharmaceuticals and contributes to the increase of the overall healthcare cost (Cherrett *et al.*, 2012; Papalex, 2017). Healthcare literature suggests that the adoption of improvement approaches and innovative interventions could enhance healthcare supply chains and assists in reducing waste and providing improved services (Bhakoo *et al.*, 2012; Pohjosenperä *et al.*, 2018).

The investigation into aspects of innovation that can be adopted within the healthcare sector, which has been a popular but not yet fully established subject, can offer a significant contribution to knowledge (e.g. Govindan *et al.*, 2015; Bamford *et al.*, 2015). In addition to this, research focused particularly on the PSC has been inspiring (Kumar *et al.*, 2009; Xie and Breen, 2014; Chen *et al.*, 2019). Specifically, the identified gap in the literature, where academics and practitioners question and argue whether innovative initiatives can be adopted and implemented within the highly complex pharmaceutical delivery system, has been recognised (e.g. Westrick and Mount, 2009; Bhakoo *et al.*, 2012; Narayana *et al.*, 2014; Bravo and Carvalho, 2015; Campos *et al.*, 2017; Lima *et al.*, 2018; Papalex *et al.*, 2020). Innovation is understood from the definition of Freeman *et al.* (2006) who indicates that in order for an intervention to be innovative, it must change the systems of production and characteristics of an organisation, **in other words the operationalisation.**

Addressing this research gap, this study aims to provide additional theoretical and practical insights to the medicine delivery practices, which will have potential implications for supply chain theory and practice. It is concerned with investigating the nature of this phenomenon through assessing the innovativeness of the current delivery processes taking place within the downstream domain of the PSC employed in two diverse European contexts: the UK and Greece. Existing literature mainly focused on the upstream domain of the PSC that includes the pharmaceutical manufacturers (e.g. Danese, 2006; Narayana *et al.*, 2014). This study, therefore, contributes to the need for exploring the PSC downstream domain, which has been reported in the current literature (e.g. Narayana *et al.*, 2014; Bam *et al.*, 2017; Campos *et al.*, 2017; Dobrzykowski, 2019). Moreover, it will assess how the adoption of innovative approaches, such as Lean Philosophy (Randor and Barnes, 2007), Reverse Logistics (RL) (Defee *et al.*, 2009; Kumar *et al.*, 2009, Breen and Xie, 2015)

and Information Technology (IT) systems, can overcome **supply chain operational** inefficiency, while optimising the PSC downstream network. The lack of focus on the combination of innovative approaches that are considered as the most effective ways to manage the PSC has been emphasised in the literature (e.g. Kang Sherman Heng and Loosemore, 2013; Campos *et al.*, 2017). Our paper attempts a contribution that is both rigorous and relevant (Hodgkinson and Rousseau, 2009) by considering both a theoretical and practical problem when formulating the research questions and positioning the contributions (Nicholson *et al.*, 2018). According to Nicholson *et al.*'s (2018) contribution conceptual framework, this paper makes an incremental contribution, which is measured against what knowledge already exists and by developing further what is currently known. Indeed, Cheng *et al.* (2009) suggested that fruitful theoretical and practical insights are generated by interdisciplinary research. To the best of our knowledge, this multimethod research is underrepresented in the PSC literature.

This paper is structured as follows: the next section presents the relevant literature, arguing that innovation could act as a catalyst in improving PSC efficiency. Then, in the methodology section, the research approach adopted to explore the subject under investigation is presented. Subsequently, the findings detail the current medicine delivery practices undertaken in both the UK and Greece and outline the identified factors that support or prevent innovative programmes that can be applied within the downstream domain of the PSC. The discussion section highlights the contribution of the study, providing additional theoretical and practical insights to highly complex PSC. The final section reports the conclusions and limitations of the study.

## **2. Literature review**

The need for improving the production of healthcare services with respect to the quality of service, patient safety and satisfaction, and the cost of care is now widely accepted (Dobrzykowski, 2019). The increased pressure on healthcare organisations to reduce their pharmaceutical spending converts

this need into a crucial one (Lainez *et al.*, 2012; Al-Balushi *et al.*, 2014). It is believed that the effective management of the PSC could minimise the perceived waste and associated costs, as well as enhancing service quality (Breen and Xie, 2015; Altug and Sahin, 2019; Papalexi *et al.*, 2020). It is envisaged that these could be attained by adopting innovative approaches in the pharmaceutical supply chain process, and by exploring the integration of lean thinking, reverse logistics and information technology from a theoretical standpoint.

Academic literature focusing on the PSC indicates that the application of innovative tools and techniques reduces pharmaceutical waste and enhances the quality of healthcare services (e.g. Breen and Xie, 2015; Pohjosenperä *et al.*, 2018), improves the effectiveness of inventory control (e.g. Pereira *et al.*, 2014; Bam *et al.*, 2017), increases firm innovativeness (e.g. Gölgeci and Ponomarov, 2015; Papalexi, 2017), enhances information reliability (e.g. Chowdhury and Quaddus, 2016) and organisational performance (e.g. Birkie *et al.*, 2017; Chen *et al.*, 2019). In a similar vein, from a practical perspective, reports have been published by healthcare institutes, such as the Department of Health and Social Care (UK) and the National Organisation for Medicines (Greece) which aim to guide healthcare organisation on how best to implement innovative approaches to improve the delivery of medicines (DHSC, 2019; NOfM, 2016). However, implementing innovation within the PSC is not yet effective; at present there appears to be a lack of experience and knowledge of how such initiatives should be implemented (Narayanamurthy *et al.*, 2018).

## **2.1 Innovation in the PSC**

Scholars exploring the PSC highlight the benefits generated by adopting innovation. Theoretical innovations such as Lean thinking (Burgess and Radnor, 2013; Baker, 2014), along with technological innovations such as ‘Radio Frequency Identification’ (RFID) (Wamba *et al.*, 2013; Shafique *et al.*, 2019) and the development of information technology (IT) (Cranfield *et al.*, 2015) are being implemented throughout the Pharmaceutical Supply Chain (PSC). Initial interventions have focused on applying Just-In-Time (JIT) approaches (Braga *et al.*, 2015) and inventory control systems

such as Vendor Managed Inventory (VMI) (Mustaffa and Potter, 2009; Bhakoo *et al.*, 2012); Weraikat *et al.* (2019) used VMI to explore the quality of expired medications at hospitals. The application of Lean Philosophy and Reverse Logistics (RL) has been suggested as a solution to reduce preventable pharmaceutical waste and increase the quality of healthcare services (Kumar *et al.*, 2009; Breen and Xie, 2015), but more evidence will be necessary to support this approach. Kumar *et al.* (2009) analysed the pharmaceutical supply chain using the Define, Measure, Analyse, Improve and Control (DMAIC) process for improvement of reverse logistics. They found that specific information on the Pharmaceutical Supply Chain was limited because the majority of the reverse logistics for pharmaceuticals is handled through third-party providers. Papalexi *et al.* (2015) focused on the implementation of the kanban system on the supply chain for a group of cooperative pharmacists proposing that the organisation can store 56.8% fewer products and spend 71.8% less money, by adopting the kanban system. Simulation modelling and outsourcing of noncritical medical supplies were examined by scholars such as Battini *et al.* (2013) and Franco (2018), aiming at reducing inventory costs without influencing the quality of services. Danese (2006) suggested the use of Information Technology (IT) across the network for sharing and exchanging information and highlighted the significance of trust within it. According to Raghupathi and Raghupathi (2014), there is a potential to improve care, save lives and lower costs through identifying associations and understanding patterns and trends within the healthcare data.

## **2.2 Barriers to innovation uptake and implementation**

Although innovation within healthcare attracts scholars' interest, reviews of healthcare reforms and performance have confirmed that innovation in the healthcare sector is considered to lag behind that of non-healthcare sectors (Bhakoo *et al.*, 2012). Studies have concluded that the PSC's complexity is the reason for the sector's difficulties in adopting innovative approaches (Williams, 2011). Several factors contribute to the complexity of the PSC, as reported by Xie and Breen (2012), Bhakoo *et al.* (2012), and Papalexi *et al.*, 2020 among others. Initially, the complexity of the delivery system is

increased due to the involvement of numerous stakeholders within the PSC that have diverse roles and responsibilities (de Vries and Huijsman, 2011). Actors of the PSC tend to operate independently and any change that might impact upon their role could be perceived as a threat (Burnes and Jackson, 2011). Individual perspective, attitude and knowledge are likely to influence the success rate of innovation (Greenhalgh *et al.*, 2012). In addition, a high level of trust and information sharing is often difficult to achieve within systems where myriad actors are involved; the success of innovative interventions relies on such ingredients (Simchi-Levi *et al.*, 2008). Therefore, observing the pharmaceutical supply chain from a system complexity perspective (Yarosan *et al.*, 2020; Blackhurst *et al.*, 2004) is deemed appropriate in the context of this research.

Furthermore, forecasting as part of information technology and reverse logistics dimension, is proven to be a challenging process for pharmacies because, on one hand, pharmaceutical products are stored in several areas throughout the PSC (Mustaffa and Potter, 2009) generating a number of inventory points that all need to be clearly captured by an integrated information system and, on the other hand, there is a high level of demand variation (Danas *et al.*, 2006) that indicated the dynamic aspects within this complex system. The unpredictable demand does not support the push logistics practices that are currently employed and, as a result, high levels of safety stock are put in place to ensure the products' availability (Bhakoo *et al.*, 2012), therefore avoiding stock-outs on critical products. Considering that medicines are relatively sensitive and expensive products, carrying safety stock increases the likelihood that these products will expire and more waste will be generated, which affects the population's health and the ecological environment (Wang *et al.*, 2015). Therefore, adopting innovative processes in order to monitor products and their safety stock by using an integrative information system, avoid waste by implementing and considering lean principles, and bring back products in the supply chain has the potential to generate value to PSC.

Interestingly, the existence of institutional and regulatory pressures might prevent the adoption and diffusion of innovation (Shah, 2004). Narayanamurthy *et al.*, (2018) stated that healthcare organisations are considered to be relatively centralised. Within functionally centralised

organisations, the process of implementing innovative programmes might be ineffective or considerably slow (Bamford *et al.*, 2015).

In addition, healthcare professionals have limited knowledge of innovation and the existing information on this is not always accessible, especially in the area of organisational and process innovations (Grol and Wensing, 2004; Greenhalgh *et al.*, 2012). As a result, there is a shortage of expertise and methods, which means that healthcare professionals find it difficult to support such implementations. The lack of experience might lead to adoption of incorrect methods or the sub-optimal use of the existing guidance, which explains why this sector is behind in adopting and implementing effective Supply Chain management (SCM) approaches (Bhakoo *et al.*, 2012). Finally, the limited financial resources available and the lack of Supply Chain Management (SCM) knowledge can act as obstacles when attempts at implementing innovative healthcare initiatives are undertaken (e.g. Davies and Edwards, 2013).

Figure 1 presents the complexity of the PSC by adapting the fundamental operations system. This was developed based on the literature detailed above. This was adopted because it is an effective and simple way to describe the production of a process, in this case the process is the delivery of medicines. It provides information about the inputs that a production of a process requires, the elements included during the production and the outputs of a process. Particularly, Figure 1 considers as inputs the different groups of stakeholders involved within the PSC, such as pharmaceutical companies, wholesalers, suppliers, the Government and communities; each having a different role that influences the delivery of medicines, e.g. the quality and quantity of pharmaceutical products. In Figure 1, there is an (blue) arrow showing that the inputs contribute to the production of the process. There are also many elements that affect the production phase of healthcare services as noted in Papalexli (2017), such as distribution networks, inventory management, demand and availability of products, transportation, global movement, drug research and development, illness, population growth and quality of life, treatment and drug prescription and others, which increase the complexity and impact upon the delivery process, and as a result the quality of healthcare services that the

customers (outputs) receive. As Figure 1 illustrates, the production of the delivery process links (using an **blue** arrow) to the outputs of the process; in this case, the areas that the medicines are delivered/consumed, such as hospitals, pharmacies, patients and society. PSC literature indicates that a number of challenges need be addressed in order for the medicine delivery system to be improved. These are related to the high cost of services, lack of finance, high level of wastage, lack of transparency and visibility, lack of communication, lack of information and knowledge and even lack of strategy (Mustaffa and Potter, 2009; Bhakoo *et al.*, 2012; Xie and Breen, 2012; Papalexi *et al.*, 2020). Every time that a delivery process is completed, those challenges have to be considered in order for the next delivery process to be improved, as Figure 1 presents **(using the black arrow)**.

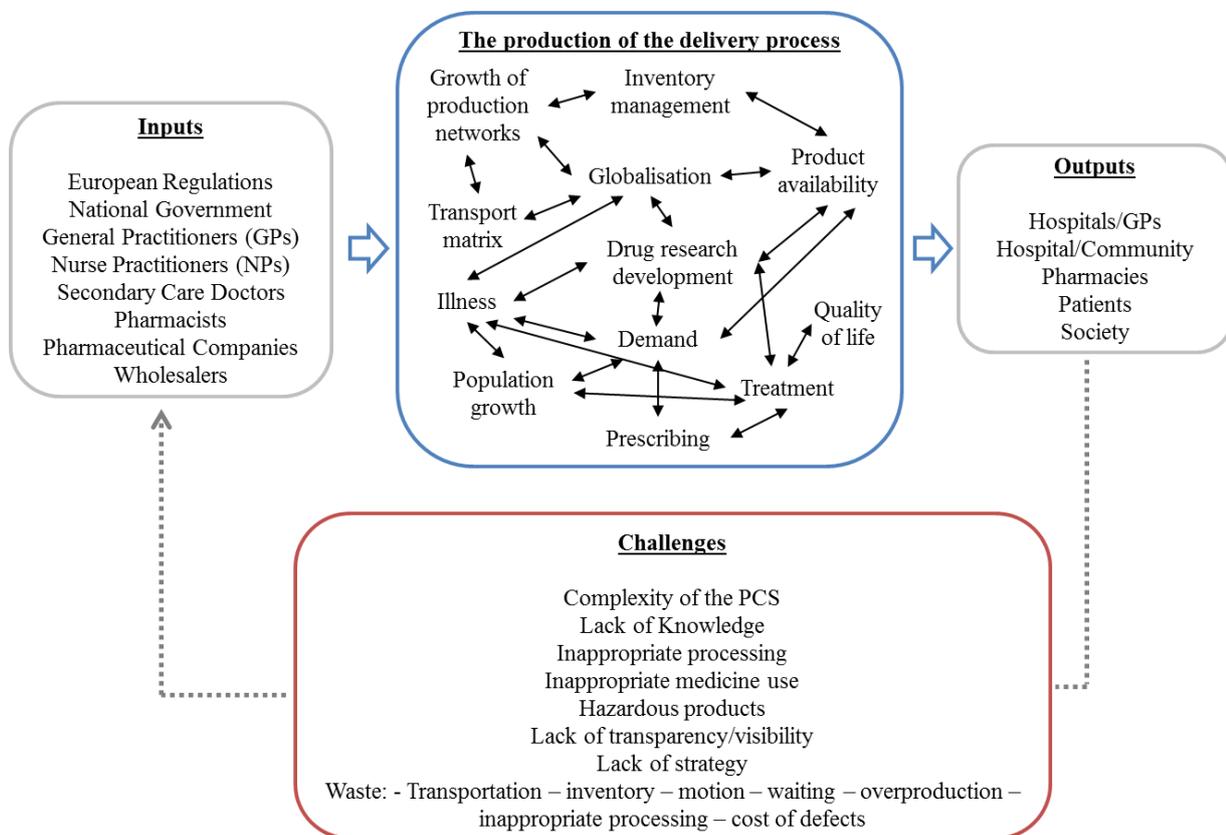

Figure 1: A fundamental model of the Pharmaceutical Supply Chain and Society

### 3. Research Methodology

#### 3.1 Research Context

This exploratory research adopts a mixed-method approach, aiming to investigate aspects of innovation within the complex PSC environment and in particular, the impact of innovation on the medicine delivery process employed within the downstream domain of the PSC in the UK and Greece. A mixed-methodology has rarely been used before for examining PSC-related research (Narayana et al., 2014) despite its potential to serve for the mutual validation of data and findings, as well as for the production of a potentially more coherent and complete picture of the investigated domain than mono-method research can yield (Kelle, 2006). The selection of these particular countries was deliberate, as it has been demonstrated that region-dependent environmental and organisational influences have affected the pharmaceutical delivery systems. For example, although the two selected countries have to follow the same European legislation regarding the management of pharmaceuticals (EMA, 2014), their different healthcare system structures impact upon the PSC's effectiveness. In addition to this, in the era of the global financial recession, the scars of the crisis are more prominent in Greece than in the UK, which might cause particular effects in terms of capacity and resources. In 2018, the UK spent \$4,070, per capita while \$2,238, per capita was allocated to healthcare spending in Greece (OECD Health Data, 2019). However, Greece spent proportionally more on pharmaceuticals as a share of GDP (26.3% health expenditure, in 2017) than the UK (11.4% health expenditure, in 2017) (OECD Health Data, 2019).

The two healthcare systems are also different *per se*. The UK one places more emphasis on developing the primary healthcare settings to promote health and deal with disease at an early stage (Lionis *et al.*, 2009). The Greek healthcare system focuses more on curative services (Souliotis and Lionis, 2005). This is supported by the fact that the share of public resource that is spent on healthcare in the UK (\$3,138/77.1%) is greater than that in Greece (\$1,342/59.9%) (OECD Health Data, 2019). In addition to this, the Greek healthcare system involves a higher ratio of physicians (6.2 per 1000 inhabitants, in 2018) and a lower ratio of nurses (3.3 per 1000 inhabitants, in 2018) than the UK healthcare system (2.9 physicians per 1000 inhabitants; 7.8 nurses per 1000 inhabitants) (OECD Health Data, 2019).

This research investigates the UK PSC as a whole because pharmacy practice throughout the UK is very similar with some local variations due to local management/devolution. For example, Northern Ireland has its own Pharmaceutical Society, which advises and regulates the profession whereas England, Scotland and Wales are regulated by the General Pharmaceutical Council (Great Britain) and advised by the Royal Pharmaceutical Society of Great Britain and other pharmacy membership organisations. Pharmacists receive the same professional training so they can practice across these locations (GPhC, 2011). Services offered within hospital and community pharmacies are similar.

Our aim is to investigate the complex pharmaceutical delivery process adopted and applied within the two diverse contexts; thus the reason for choosing the UK and Greece PSCs. This approach enabled the identification of similarities and differences between the two delivery systems and helped improve and expand our understanding of the PSC downstream domains beyond the context of a single country.

Data was collected from both hospital and community pharmacies. Hospital pharmacies generally are more removed from the patient within their local community by their placement and role within the supply chain. Due to the nature of hospital services and resource availability there is a higher expectation of hospital pharmacies to source materials quickly especially in cases of emergencies or product shortages. As hospitals are vanguards of service delivery, pharmacy services will be more advanced than community pharmacy. There will be greater ICT innovation in relation to access to patient records, transfer of discharge records and medicines to GPs and community pharmacies (Galloway, 2021). Traditionally community pharmacists have a more restricted diet of activity as standard (mainly dispensing of medicines) but have extended this offering to include more service innovations such as medicines use consultations, public health awareness, health promotion etc (Baird and Beech, 2020).

### **3.2 Research Design**

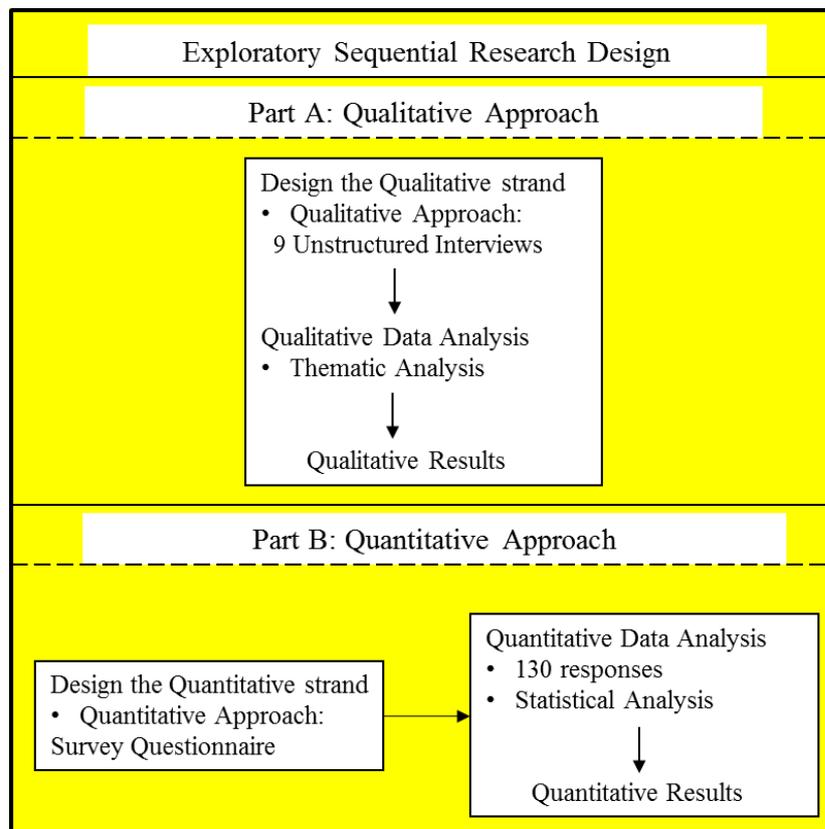

This study adopted an exploratory mixed-method design to address the research questions. Specifically, the qualitative data collected via unstructured interviews helped the authors build an initial in-depth understanding of the elements defining the downstream PSC delivery. The survey went a step further and was more innovation-centric per se so that complementary results looking at various facets of the studied phenomenon could be generated as Golicic and Davis (2012) have reported. Fawcett and Magnan (2002, pp.343) suggested that “combining surveys with interviews in a complementary research design yields a rich and robust view of modern supply chain integration practice from different points of view” something that we adopted. This mixed-method approach is also in line with previous studies (e.g. Feldon and Kafai, 2008; Creswell and Plano Clark, 2011). A representative example of a healthcare study is Schadewaldt *et al.* (2014); the study focused on human factors trying to identify the characteristics of collaboration between nurse and medical practitioners in the primary healthcare sector.

### 3.2.1 Exploratory Design

The exploratory sequential design commences with the qualitative strand of activity, which aims to appreciate the context and its singularities. An in-depth understanding of professionals’ views and experiences was vital for developing an initial understanding of the current pharmaceutical delivery system applied in the UK and Greece. This allowed us to develop the complementary (to the qualitative findings) direction, content and nature of the survey instrument; the survey questions (see Appendix) concentrate on areas that were not entirely covered by the qualitative themes and expanded the study’s focus to a more direct innovation-based context. This ‘feeding’ approach supported by the use of our mixed method research design improved the holistic character of the study.

The quantitative approach was adopted as a follow-up to the qualitative work, to gain ‘more measurable’ results that could more accurately describe the phenomenon under investigation and offer statistical results. While the qualitative work helped the identification of the key building blocks of the overall procedure the survey entered more explicitly the innovation parameter per se. The

questionnaire was distributed to hospital and community pharmacy professionals working within the downstream domain of PSC in the UK and Greece. The Total sample (N=130) consisted of 81 hospital and community pharmacies working within the PSC in Greece and 49 pharmacy specialists who operate in the UK. The collection of the quantitative data enabled us to identify the factors that influence the innovation level of the current delivery process and to suggest alternative solutions to improve this process for the benefit of stakeholders and patients. Figure 2 illustrates the methodological framework of the present study.

*Figure 2: The Research Design Adopted*

### 3.3 Data collection, sample population and data analysis

#### 3.3.1 Qualitative approach

The qualitative data were collected via a series of site visits and one-to-one unstructured interviews with key pharmacy professionals working in hospital and community pharmacies in the UK and Greece. This approach was adopted, on one hand, to form a more comprehensive view of the current

medicine delivery process and, on the other hand, as a process supporting the content and direction of the survey. In total, nine unstructured interviews lasting two hours on average were undertaken: five in the UK and four in Greece. The interviews provided enough data to cover the research content; the authors stopped when the saturation level was reached meaning that the process was becoming repetitive (O'Reilly and Parker, 2012). Each interview was audio-taped and transcribed verbatim. Table 1 presents key interviewee characteristics aiming to provide information related to their background, which potentially influence their views regarding the study subject, for example the key question presented in the final column (supply chain operation innovativeness) were only two believed innovation existed. A challenge with the research is understanding the context of their response on aspects of innovation.

*Table 1: Participants' Characteristics*

#	Reference	Gender	Position	Working Experience	Supply chain operation Innovativeness
1	1/UK	F	Lead hospital Pharmacist	12 Yrs	Unsure
2	2/UK	M	Chief community Pharmacist	8 Yrs	Unsure
3	3/UK	M	Chief community pharmacist	6 Yrs	Yes, the supply chain operation is innovative
4	4/UK	M	Procurement and Homecare Manager (hospital pharmacist)	7 Yrs	No, the supply chain operation is not innovative
5	5/UK	F	Chief hospital Pharmacy Technician	2 Yrs	Yes, the supply chain operation is innovative
6	6/Gr	M	Community Pharmacist	11 Yrs	Unsure
7	7/Gr	M	Hospital Pharmacist	13 Yrs	No, the supply chain operation is not innovative
8	8/Gr	F	Community Pharmacist	22 Yrs	Unsure
9	9/Gr	F	Hospital Pharmacist	15 Yrs	No, the supply chain operation is not innovative

In this research, the target sample involves professionals working in hospital and community pharmacies in two diverse geographical areas: Greece and the UK. This research aims to explore how innovative programmes could improve the downstream domain of the PSC, which is directly related to patients, identifying the related issues. This study adopted a purposive sampling technique (Tongco, 2007) in order to address the research aim, therefore, only those specialists who work within this domain could be considered as potential participants. The exact number of pharmacists that operate within the particular study area is not available. However, according to Eurostat (2018) statistics 104.9 per 100,000 inhabitants was the number of professionally active pharmacists in Greece and 86.2 per 100,000 inhabitants in the UK.

During the qualitative data collection, the authors faced difficulties in approaching the potential interviewees. They were very cautious about being involved in this research, mainly because they thought that their role was not related with Operations Management (OM) or Supply Chain Management (SCM) practices. They were, therefore, excluded due to concerns related to the minimum knowledge about these particular practices and organisational performance (e.g. Nulty, 2008). In addition to this, some of the potential participants were reluctant to take part in this study because of their heavy work load. The authors approached only those specialists that could be reached in terms of geographical distance. Although the described issues illustrate the magnitude of the challenge faced, finally, nine unstructured in-depth and lengthy interviews were undertaken that provided data to address the aims of this research.

The qualitative data were thematically analysed; thematic analysis has been widely used as a foundational method for analysing qualitative data (Guest *et al.*, 2012). Themes organise a group of repeating ideas, which allows researchers to answer the research questions (Vaismoradi *et al.*, 2016). There are numerous reported articles referring to thematic analysis agreeing that there is no right or wrong way to conduct it (Vaismoradi *et al.*, 2016). In this research, the analysis of the research interviews was conducted using Braun and Clarke's (2013) linear model for carrying out thematic analysis as adapted by Nikitas *et al.* (2018; 2019). This model includes six procedural steps: i)

Familiarisation with the data; ii) Generation of initial codes; iii) Searching for themes; iv) Reviewing themes; v) Defining and naming themes; and vi) Producing the final report. This process was influenced by the presented conceptual framework, deductively informed by the literature review and guided by the authors' specific research interest.

### **3.3.2 Survey approach**

A quantitative survey was employed to: i) capture the level of innovation applied during the delivery of medicines; and ii) identify the factors that influence positively or negatively the decision of hospital and community pharmacies to innovate. A mail type and a web type questionnaire survey were used for this research to raise the response rate and reduce the collection time (Groves *et al.*, 2011). Considering that the survey was distributed to professionals working within the PSC in the UK and Greece, two different versions were created to ensure that the respondents could accurately understand the survey and provide answers that best represent their views (Cha *et al.*, 2007). The questionnaire was initially developed in English and then translated to Greek. Particularly, the back translation technique was adopted, which involves two translation processes: i) initially the questionnaire was translated from the source language (English) into the target language (Greek) by a translator; then ii) the Greek version (target language version) was translated back into the English version (source language version) by another translator; and finally the two different versions were compared (Maneesriwongul and Dixon, 2004).

The respondents were asked questions related to factors supporting innovation (reduced time to respond to customer or supplier needs; improved staff communication; enhanced staff or patient satisfaction), factors preventing innovation (excessive perceived economic risks; direct innovation costs too high; lack of finance), access to information, external/internal collaboration, innovation level regarding the use of technology and innovation level regarding the introduction of new/improved products/services. These particular topics clearly add to the innovation parameter in the present research, building on the results of the thematic analysis of the work's qualitative phase where the key elements of the downstream PSC delivery were first identified and contextualised. The

questions employed in the survey used multiple-item and single-item Likert-type scales. The authors employed 5-point Likert scales with a neutral mid-point. According to Dawes (2008), this is the optimal choice; they are as precise as 7-point Likert scales, but less cognitively challenging. Please see Appendix 1 for the full version of the questionnaire and Appendix 2 for the measurement items for study constructs.

As a snowball sampling technique was used, using the nine interviewees as propagators of the survey participation call, and since the questionnaire was mainly distributed through mail accounts and web accounts, the actual response rate is difficult to indicate. This is one of the disadvantages of this distribution strategy, but with a sample so specific and confined this was the only viable approach. The final sample (N=130) consisted of 81 specialists working within the PSC in Greece and 49 specialists located in the UK. Table 2 summarises the sample size and its key characteristics.

*Table 2: The sample size and characteristics*

	National Context	Sample Size	Sample Characteristics				
			Working Experience		Educational Level		
			> 15 Years	< 15 Years	Professional Qualification	Bachelor's Degree	Postgraduate Degree
<b>Total Sample</b>	Greece + UK	130	68%	32%	18%	69%	13%
<b>Greek Sample</b>	Greece	81	62%	38%	6%	94%	-
<b>UK Sample</b>	UK	49	78%	22%	37%	36%	27%

Two types of statistical techniques were adopted: descriptive and regression analyses. A Linear Regression Analysis (LRA) was conducted to assess the relationships between all pairs of variables in the study (Gravetter and Wallnau, 2011) followed by a multi-group regression.

#### **4. Findings - Qualitative and Quantitative Data Analysis**

##### **4.1 Describing the downstream delivery process: a qualitative approach**

The qualitative data analysis highlighted key areas that describe the current pharmacy delivery practices in the UK and Greece, including: *Outbound operations* (the supply routes), *Inbound operations* (delivery processes), inventory management and the perceived level of system wastage. Table 3 presents these themes using raw quotes provided by the interviewees; care was taken to accurately present the most representative interviewee insights instead of centring this analysis on our own interpretations thus reducing analyst bias.

Table 3: The emerged themes with evidence from the interviews

Themes	Example quotations	
	Hospital pharmacies	Community pharmacies
Outbound operations (or 'supply routes')	<p>Three different supply routes</p> <ol style="list-style-type: none"> <li>1. Medication for general use (stored in the wards' cupboards)</li> <li>2. Medication issued for a particular patient (stored in the box next to the patient's bed)</li> <li>3. The discharged medication (used at home)</li> </ol> <ul style="list-style-type: none"> <li>• <i>"doctors on wards prescribe medication electronically [...] Subsequently, the prescription can be either checked by a pharmacist on the ward or in the dispensary and then we print it off and complete the prescription"</i> (1/UK)</li> <li>• <i>"we still deliver medication using a paper-based process. Electronic prescription has been introduced and even used in some hospitals but the problem that we face is that doctors do not have time to spend on electronic prescription"</i> (9/Gr)</li> </ul>	<p>One type of supply route</p> <ul style="list-style-type: none"> <li>• <i>"our main concern is about the availability and quality of drugs [...], we can manage both of them quite well"</i> (3/UK)</li> <li>• <i>"it is a routine process [...] our only challenge is to understand what is written on the prescription [...]. The electronic prescription has solved this problem but we still have to decode some of them which are handwritten"</i> (8/Gr)</li> </ul>
Inbound operations (or 'delivery processes')	<p>Hospital pharmacies in the UK and Greece tend to order the required products five days per week, twice a day.</p> <ul style="list-style-type: none"> <li>• <i>"wholesalers deliver items twice a day, every day and we sometimes receive an order on Saturday morning [...], so we usually have ten or eleven deliveries from each wholesaler per week"</i> (1/UK)</li> <li>• <i>"the delivery process would depend on how frequently we need the products and the agreement that we have set up with our suppliers"</i>(7/Gr)</li> <li>• <i>"approximately 90 % of the required products are delivered through wholesalers, however, there are pharmaceutical companies that prefer to supply the required items directly to pharmacies"</i> (9/Gr)</li> </ul>	<p>Community pharmacies receive the majority of required products from one main wholesaler and some from pharmaceutical companies. Community pharmacies in the UK normally receive medicines two times per day and they can easily deal with an emergency because the warehouse is located close to them.</p> <ul style="list-style-type: none"> <li>• <i>"community pharmacies in the UK tend to be big companies having many stores all over the country, such as Boots and Lloyds; they run their own warehouse, so they have better control of the products that they manage"</i> (3/UK)</li> </ul> <p>Community pharmacists in Greece have their own store but they tend to cooperate; there are 27 organisations founded by a group of cooperative pharmacists which are responsible for the smooth and regular supply of pharmaceuticals and paramedical products</p>

	<ul style="list-style-type: none"> <li>• <i>“hospitals sign up contracts with their suppliers, which enable them to receive the medicines at better prices and also build a relationship with them which, at some point, ensures the quality and on time delivery” (4/UK)</i></li> </ul> <p>Hospital pharmacies order the items using an online system.</p> <ul style="list-style-type: none"> <li>• <i>“the information system that we use enables us to check our stock level, create the next order, calculate the cost and send the order to our suppliers” (4/UK)</i></li> <li>• <i>“the information system enables us not only to check and order stock but also inform them about any type of changes, such as cost or stock changes” (7/Gr)</i></li> </ul>	<p>to the pharmacies operating in the same geographical area - there are approximately 6,000 associate member pharmacies.</p> <ul style="list-style-type: none"> <li>• <i>“we are quite satisfied with the foundation of such an organisation; it works like a wholesaler for us and we order more than 90% of the required medicines from it [...]we are able to receive items five or six times per day; we can have them within an hour of the order” (6/Gr)</i></li> </ul> <p>Community pharmacies in both countries order the required products using an online system that is similar to that used by the hospital pharmacies, albeit more developed.</p>
Inventory Management	<p>To ensure the availability of medicines and minimise the risk of them being out of stock, hospital pharmacies have an average of two weeks’ stock and stock check them frequently.</p> <ul style="list-style-type: none"> <li>• <i>“according to our national guidance, we have to store some medicines, such as some antidotes for poisoning [...], but generally we keep two weeks’ safety stock” (5/UK, 9/Gr)</i></li> <li>• <i>“we do stock check the whole stored supply during the year to minimise the risk of the medicines being out of date” (7/Gr)</i></li> <li>• <i>“once the stock check has been done, if we discover that there are some short dated items we can swap them with other medicines from the Co-operative pharmacy; we have set up an agreement with the Co-operative pharmacy which helps us to reduce the waste of ‘unused’ medicines” (1/UK). This type of agreement does not exist in the Greek system.</i></li> </ul>	<p>Community pharmacies in both countries do not tend to keep safety stock because they are able to order and receive medication immediately</p> <ul style="list-style-type: none"> <li>• <i>“We just keep enough quantities of the medicines that we sell more frequently” (8/Gr)</i></li> <li>• <i>“there is no need for keeping safety stock [...], we keep two days’ stock to ensure that our customers are satisfied (3/UK)</i></li> </ul>
Perceived level of system wastage	<p>The level of wastage is very high and it mainly occurs at ward level.</p> <ul style="list-style-type: none"> <li>• <i>“the ward staff has the responsibility to manage their own stock of medicines [...] considering that their main focus is to treat patients properly, they have limited time to focus on stock related issues, something that in general increases the level of wastage” (9/Gr)</i></li> </ul>	<p>The level of wastage is not particularly high.</p> <ul style="list-style-type: none"> <li>• <i>“the level of wastage is low within the pharmacy because we do not really store products” (8/Gr)</i></li> <li>• <i>“we are quite good in managing our products [...]; the information system that we use informs us about the level of stock that we have; there is a minimum and maximum</i></li> </ul>

	<ul style="list-style-type: none"> <li>• “stock checking is not an essential part of the nursing role and they have not been trained to effectively manage stock rotation, hence stockpiling and obsolescence occurs” (4/UK)</li> </ul> <p>Discharge medication issued to wards can be reused.</p> <ul style="list-style-type: none"> <li>• “sometimes medication does not follow the patient; we do not waste these medicines; they are returned back to the pharmacy and are reused”( 7/Gr)</li> <li>• “we supply approximately £30 million of medication per annum of which £36,000 per annum is returned and reused” (1/UK)</li> </ul> <p>On various occasions, medicines cannot be re-used.</p> <ul style="list-style-type: none"> <li>• “a lot of times patients bring their medication with them, if, according to their condition, this medication has to be changed, we are not allowed to use the previous one based on the national guidelines” (9/Gr)</li> <li>• “there is the guidance from the General Pharmaceutical Council which does not allow us to use any medication issued by a community pharmacy or another hospital [...], this is reasonable because we cannot attest the source and control of it” (1/UK)</li> </ul>	<p>level of stock and when it gets down to a certain level that is the critical point where we have to re-order” (2/UK)</p> <p>The biggest amount of waste comes from patients</p> <ul style="list-style-type: none"> <li>• “patients have not been educated to bring their spare medication back to the pharmacy; they tend to keep it just in case they need it in the future [...] we are able to collect the unusable medication; there is a DOOP bin in each store where any patient returns or any out of date stock can go into. Subsequently, those medicines are collected and destroyed by the local authority” (3/UK)</li> <li>• “according to national guidance, each pharmacy has to display a bin for collecting the unused medication. On the one hand it is hard to persuade patients to bring back their spare medicines and on the other hand the local authority does not collect them often” (6/Gr)</li> </ul>

## **4.2 Survey Analysis-Level of Innovation within the downstream domain of the PSC**

With the development of an understanding about the key elements of the process from the qualitative phase, measuring the existing level of innovation and identifying the factors that support or prevent innovative programmes that can be applied within the downstream domain of the PSC through LRA, was the follow-up research step taken. The results of this analysis are presented in the following subsection, testing three innovation-focused hypotheses as these have been developed by the authors' literature review, qualitative phase and their parallel research (Papalexi et al., 2020). The hypotheses endeavoured to investigate critical relationships between particular aspects of innovation as expressed by technology uptake and introduction of new/improved products and services and perceived innovation barriers and enablers.

*Hypothesis 1(H1): Reduced time to respond to customers/suppliers (a), improved staff communication (b) and enhanced staff/patients' satisfaction (c) are positively related to the innovation level regarding the use of technology (i) and the introduction of new/improved products/services (ii).*

*Hypothesis 2 (H2): Economic risk (a), cost of innovation (b) and lack of finance (c) are negatively related to the innovation level regarding the use of technology (i) and the introduction of new/improved products/services (ii).*

*Hypothesis 3 (H3): Access to information (a) and external/internal collaboration (b) are positively related to the innovation level regarding the use of technology (i) and the introduction of new/improved products/services (ii).*

### **4.2.1 The study variables**

The quantitative analysis contains 10 variables; each of which was operationalised on a 5-point Likert scale. The study variables are presented in Table 4. Variables 2-9 are the independent variables for

this study. The two dependent variables (10-11) are: the *innovation level regarding the use of technology* and the *innovation level regarding the introduction of new/improved products/services*. These are two diverse forms of innovation; however, as was apparent from the qualitative data analysis, there is no clear distinction between them, as input of technology could affect the service outputs. Table 4 also presents key descriptive statistics: means, standard deviations and correlations between the study variables. No concerns are raised regarding common method variance or multicollinearity issues regarding the specific variables in the data set.

*Table 4: Means, standard deviations and correlations between the study variables (N = 130)*

	Mean	SD	1	2	3	4	5	6	7	8	9	10	11
1 Reduced time to respond to customers/suppliers	4.02	1.05	.270**	-									
2 Improved staff/patients communication	3.51	1.10	-.014	.383**	-								
3 Enhanced staff/patients satisfaction	3.88	1.01	.236**	.550**	.618**	-							
4 Economic risk	3.87	1.03	-.223*	.095	.029	.037	-						
5 Cost of innovation	4.03	.93	-.251**	.040	-.012	-.071	.759**	-					
6 Lack of finance	3.96	.99	-.292**	.023	.044	.018	.610**	.716**	-				
7 Access to information	3.59	.75	.076	.383**	.445**	.523**	-.059	-.167	-.087	-			
8 External/internal collaboration	3.58	.82	-.142	.182*	.290**	.275**	.112	.069	-.050	.284**	-		
9 Innovation Level- Technology	4.01	.85	.086	.269**	.107	.159	.015	-.050	-.083	.234**	.297**	-	
10 Innovation Level-New/improved products/services	3.51	.83	-.062	.147	.268**	.192*	-.198*	-.151	-.110	.299**	.283**	.437**	-

Note. \*\*  $p < .01$ , \*  $p < .05$

#### **4.2.2 Linear Regression Analysis**

The results of the LRA, a statistical method frequently used in health care research (e.g. Westrick and Mount, 2009; Boulet *et al.*, 2016), represent the best prediction of how the innovation level applied within the PSC can be influenced by the eight independent variables. Subsequently, a multi-group regression analysis will be presented, aiming to assess and compare the relationship among the study variables in the two different European contexts. Several researchers have adopted this approach when they attempt to compare diverse groups with small, in some cases, sample size (e.g., Esfahbodi *et al.*, 2016; Manning *et al.*, 2016).

### ***Results in the Total sample: Innovation Level - Technology and New/improved products/services***

According to Hypothesis 1, reduced time to respond to customers/suppliers (a), improved staff communication (b) and enhanced staff/patient satisfaction (c) were expected to relate positively to the innovation level regarding the use of technology (i) and the introduction of new/improved products/services (ii). Table 5 indicates that improved staff communication and enhanced staff/patient satisfaction were not significantly related to the innovation level regarding the use of technology and the introduction of new/improved products/services. Therefore, H1bi, H1ci, H1bii and H1cii have been rejected in the total sample. Reduced time to respond to customers/suppliers was significantly and positively related to the innovation level regarding the use of technology, but negatively related to the introduction of new/improved products/services. Based on this result, H1ai has been accepted and H1aii rejected in this case.

For Hypothesis 2 assumed that economic risk (a), cost of innovation (b) and lack of finance (c) are negatively related to the innovation level regarding the use of technology and the introduction of new/improved products/services (ii). Table 5 indicates that cost of innovation and lack of finance were not significantly related to the innovation level regarding the use of technology and the introduction of new/improved products/services. Therefore, H2bi, H2bii, H2ci and H2cii have been rejected in the total sample. Economic risk was significantly and negatively related to the innovation level regarding the introduction of new/improved products/services, but it was not related to the innovation level regarding the use of technology. Based on these results, H2aii has been accepted and H2ai was rejected for the total sample.

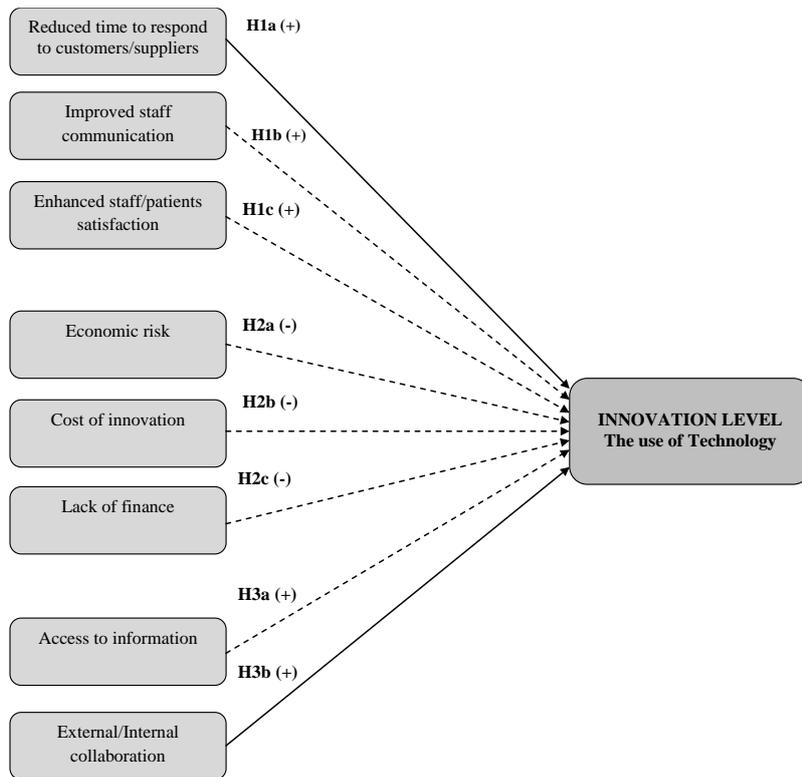

For Hypothesis 3 to be confirmed, access to information (a) and external/internal collaboration (b) would be positively related to the innovation level regarding the use of technology (i) and the introduction of new/improved products/services (ii). The results indicated that both variables were significantly and positively related to the innovation level regarding the introduction of new/improved products/services. Therefore, H3aii and H3bii have been accepted for the total sample. However, access to information has a non-significant while external/internal collaboration has a significant and

positive relationship with the innovation level regarding the use of technology. These results indicate the rejection of H3ai and the acceptance of H3bi in the total sample.

*Table 5: Results of linear regression analysis: Innovation Level - Technology and New/improved products/services (N = 130)*

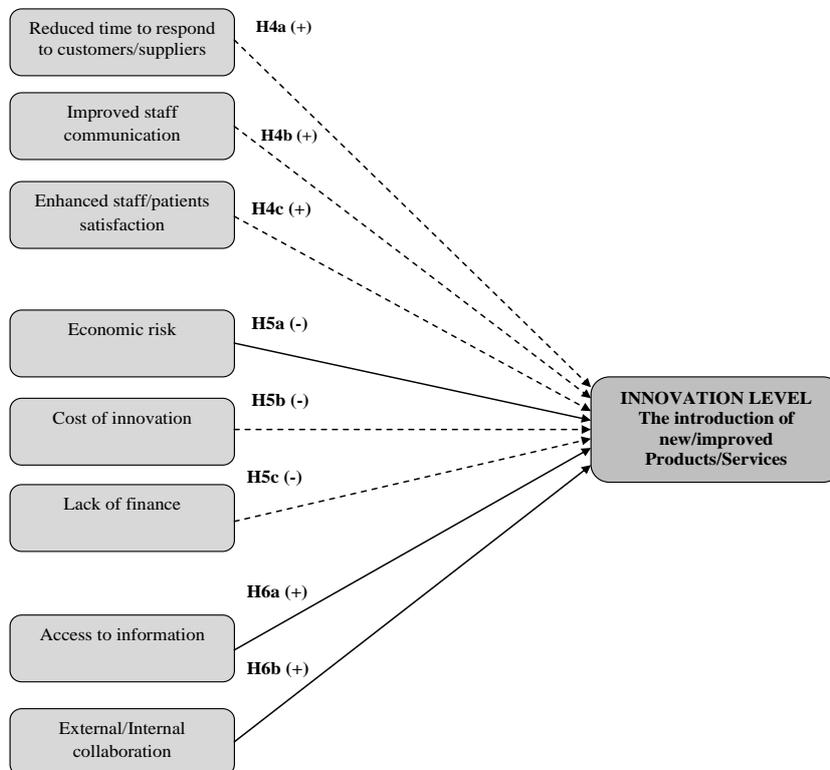

Variables	Innovation Level- Technology		Innovation Level - New/improved products/services	
	$\beta$	$p$	$\beta$	$p$
Reduced time to respond to customers/suppliers	<b>.240</b>	<b>.026</b>	.048	.647
Improved staff communication	-.096	.399	.113	.312
Enhanced staff/patient satisfaction	-.076	.558	-.031	.809
Economic risk	.069	.600	<b>-.258</b>	<b>.048</b>
Cost of innovation	-.139	.371	.040	.792
Lack of finance	.045	.735	.027	.837
Access to information	.140	.185	<b>.215</b>	<b>.038</b>
External/internal collaboration	<b>.284</b>	<b>.003</b>	<b>.221</b>	<b>.019</b>

Results suggest that two factors, reduced time to respond to customers/suppliers and external/internal collaboration, play a significant role in positively influencing pharmacies, operating in both countries, to adopt innovative programmes, specifically through using technology. In addition, economic risk, access to information and external/internal collaboration are the factors that influence pharmacies' decision to introduce new or improved products and services. Figure 3 and Figure 4 below provide the visual representation of the significant and non-significant relationships in the total sample group.

Note. Dashed arrows represent non-significant relationships

Figure 3: Results in the Total sample: Innovation Level – Technology

Note. Dashed arrows represent non-significant relationships

10 Innovation Level-New/improved products/services	3.47	.95	3.58	.58	.232*	.316**	.244*	-.227*	-.146	-.122	.273*	.310**	.531**	-

Note. \*\* p < .01, \* p < .05; Correlations below/above the diagonal refer to the GR/UK group

***Results from the Greek and UK sample: Innovation Level - Technology and New/improved products/services***

Results as shown in Table 7 state that, both in the Greek and UK samples, reduced time to respond to customers/suppliers, improved staff communication, enhanced staff/patient satisfaction, cost of innovation and lack of finance appeared to have no significant relationship with the innovation level regarding the use of technology and the introduction of new/improved products/services. According to Table 7, the relationship between external/internal collaboration and the innovation level regarding the use of technology might influence the Greek pharmacists' decision to innovate, while this was not the case regarding the UK sample. There is an indication suggesting that aspects of economic risk might act as a barrier to the introduction of new/improved products/services in the Greek delivery system, while this was absent in the UK group. Moreover, accessing information was considered an important element that might encourage UK pharmacists to introduce new/improved products/services, but this was not the case in the Greek sample. Finally, external/internal collaboration appeared to have no impact on decisions related to the introduction of new/improved products/services in both European contexts.

*Table 7: Results of multi-group analysis: Innovation Level – Technology and New/improved products/services (GR, N = 81; UK, N = 49)*

Variables	Innovation Level - Technology				Innovation Level - New/improved products/services			
	GR		UK		GR		UK	
	$\beta$	$p$	$\beta$	$p$	$\beta$	$p$	$\beta$	$p$
Reduced time to respond to customers/suppliers	.239	.058	.017	.932	.102	.426	-.068	.723
Improved staff communication	-.084	.516	-.138	.622	.128	.334	.079	.771
Enhanced staff/patient satisfaction	.100	.508	-.009	.977	.099	.526	-.166	.567
Economic risk	-.066	.675	.156	.536	<b>-.381</b>	<b>.022</b>	-.010	.967
Cost of innovation	-.150	.400	.089	.764	.123	.503	-.204	.481

Access to information	.112	.385	.051	.784	.125	.347	<b>.483</b>	<b>.011</b>
External/internal collaboration	<b>.276</b>	<b>.025</b>	.188	.283	.194	.122	.082	.627

### ***Results in the Greek and UK sample: Innovation Level - New/improved products/services***

Overall, economic risk seems to play an important role in the Greek pharmacists' decision to introduce innovative products and services. Apparently, the current economic crisis seems to have affected the pharmacists' decision to innovate. This unpleasant situation may have made them more sceptical and cautious about undertaking such initiatives. However, developing external/internal collaboration has a positive effect on the use of technology in the Greek context. Besides, the accessibility to relevant information might influence the UK pharmacies' decision to introduce new or improved products and services. Hospital and community pharmacists in the UK tend to believe that access to required data, knowledge and information can guide them to successfully introduce new or significantly improved services and products.

## **5. Discussion**

To provide clarity to the discussion this section has been arranged around two core areas: i) Factors influencing the level of innovation within the downstream domain of the Pharmaceutical Supply Chain; and ii) Proposed Innovative programmes, which should be implemented to improvement of the downstream delivery of medicines.

### **5.1 Factors influencing the level of innovation within the downstream domain of the Pharmaceutical Supply Chain**

From the data analysis, a better understanding of the level of innovation, regarding the use of technology and the introduction of new or improved products and services, applied in the UK and Greece, was achieved. Although Rowley *et al.* (2011), focusing on innovative interventions categorised these into two diverse types of innovation: i) technical innovation (e.g. Lai *et al.*, 2008)

and ii) product/service innovation (e.g. Lewis *et al.*, 2010), Camison and Lopez (2010) argued that a clear distinction between them is not always possible.

Within this study, pharmacists operating in both geographical contexts recognised that the time to respond to customers and suppliers can be reduced by the use of technology (H1ai), this is something that is highly dependent on the knowledge and information sharing between the key stakeholders, as Kimpel (2013) and Pohjosenperä *et al.*, (2018) explained. Blackstone (2010) purported that the use of technology and especially information systems (IS) enhances supply chains' performance through creating net value, synchronising supply with demand and leveraging worldwide logistics. Particularly, as Forslund and Jonsson (2007) and Chowdhury and Quaddus (2016) indicated, an effective and efficient delivery process requires access to accurate information regarding product usage and inventory levels. However, Magal and Word (2011) explained that these data are often fragmented by functional silos. They analysed it further, saying that a number of functions within organisations are often less communicative and collaborative, which does not support information sharing. Considering the high complexity of the PSC system, sharing information and knowledge is considered a very challenging process for healthcare organisations (Danese, 2006; Narayanamurthy *et al.*, 2018). Indeed, although our participants revealed that they are quite satisfied with the software that they utilise to manage pharmaceuticals, they also stated that this is not an integrated system. The stakeholders involved within this process do not share the same IS, and so its capabilities are limited and focused only on internal practices. This can explain why pharmacists in both countries do not believe that the use of technology can improve their performance through enhancing the communication between them (H1bi) and their customers' satisfaction (H1ci).

Hypothesis 1 (H1), which assumed that reduced time to respond to customers/suppliers (a), improved staff communication (b) and enhanced staff/patients' satisfaction (c) positively influenced the innovation level regarding the introduction of new/improved products/services (ii), was rejected. Rostamy-Malkhalifeh and Mollaeian (2012) supported that the main reason for introducing new or relatively improved products and services is related to customer and staff satisfaction. However,

Simon *et al.* (2007) and Narayanamurthy *et al.*, (2018) found that healthcare organisations with strong hierarchical organisational systems have difficulties supporting new or significantly improved processes due to the current inefficiency of the system. Grol and Wensing (2004) supported this, explaining that disconnection between evidence and practice observed within the PSC has caused a slow uptake of innovation. The role of the physician as the main decision-maker (Bhakoo *et al.*, 2012) in conjunction with autonomy issues and general healthcare organisations' cultural barriers (Levenson *et al.*, 2008) appear to prevent the introduction of new or improved products and services. Healthcare personnel appear to be sensitised to changes, which means that they are more likely to perceive them as threat and react negatively (Burnes and Jackson, 2011).

From the data analysis, it is apparent that pharmacists **tend to** not consider the economic aspects of innovation, partly because they are not fully involved in the decision-making process related to the adoption of innovation and also due to the lack of knowledge and information related to the cost of innovative initiatives (H2). Bubalo *et al.* (2013) and Archibugi *et al.* (2013) reported that the cost of innovation and the lack of financial funds prevent innovation. In particular, Bubalo *et al.* (2013) investigated the aspects of technology and its effect on medication errors. Although they found that the application of Computerised Provider Order Entry (CPOE), Electronic Medical Record (EMR) and other similar software for placing pharmaceutical orders electronically has multiple benefits, the cost of implementing those types of technology were one of the limitations (Shafique *et al.*, 2019). In addition, Davenport (2013) and Franco (2018), who also focused on the financial aspects of innovation, suggested that organisations often hesitate to undertake an innovative approach, fearing the economic risk associated with this type of initiative specifically when attempts to be innovative fail. Considering that the cost of pharmaceuticals is too high (Cherrett *et al.*, 2012), pharmacies do not consider that purchasing and maintaining this type of technology requires huge investments. Wietholter *et al.* (2009) found that the cost of introducing, implementing and maintaining IS is dependent on the organisation's size. Therefore, attempts to implement this type of technology in a hospital environment could be very costly. However, the data analysis indicated that hospital

pharmacists still do not consider this particular cost as a barrier to being innovative. On the contrary, more emphasis has been placed on selecting and adopting the appropriate innovative approach to fit with the organisation's needs, which is revealed by the output related to hypothesis 3.

The data analysis of the total sample appears to confirm the positive effect of external and internal collaboration on innovation level regarding the use of technology (H3bi) and reject this positive relationship between access to information and the innovation level regarding the use of technology (H3ai). However, the total sample confirmed the positive relationship between access to information and external/internal collaboration and the innovation level regarding the introduction of new/improved products/services (H3aii and H3bii). Drucker (2014) and Papalexi *et al.* (2020) suggested that the development of synergies and information sharing between stakeholders of a supply chain enables organisations to successfully adopt innovative ideas and as a result increase their performance.

The participants in the Greek sample supported the assumed positive relationship between the development of internal and external collaboration and the use of technology (H3bi); however, the UK sample does not appear to believe that the development of collaborations enhances the use of technology. This can be explained based on the existence of technology asymmetries observed within the PSC (Archibugi *et al.*, 2013; Narayanamurthy *et al.*, 2018). Stakeholders involved within the PSC appear to operate quite independently using technology, and in particular information systems (IS), that fit within their organisational environment (Kim *et al.*, 2012; Chowdhury and Quaddus, 2016). On the other hand, UK pharmacists emphasised more the importance of access to information in introducing new or significantly improved products and services (H3aii), which is not supported by the pharmacists operating in Greece.

Finally, regarding the assumed positive relationship between the access to information and the use of technology (H3ai), the data analysis indicated that pharmacies operating in both contexts do not support it. Elements such as the centralised environment (Narayanamurthy *et al.*, 2018), the limited involvement of pharmacists in the decision-making process (Kastanioti *et al.*, 2013; Altug

and Sahin, 2019) and the organisational culture (Black *et al.*, 2011; Dobrzykowski, 2019), have been considered as barriers to implementing innovation.

## **5.2 Proposed innovative programmes to improve the downstream delivery of medicines**

The research findings analysed the Greek and UK healthcare organisations' environment in order for the innovative programmes fitting within these contexts to be identified. Bamford *et al.* (2015) suggested that the adoption of innovation tends to be dependent on organisational context and characteristics, such as: the type of waste; needs and demands of stakeholders and functional rules regarding legal context. The adoption of Lean and Reverse Logistics (RL) approaches could help pharmacies to provide greater value to customers through more effective management and use of their resources and capabilities, which would create competitive advantage (Martín-Peña and Díaz-Garrido, 2008; Ferlie *et al.*, 2016). From the research, Lean and RL are still considered as moderate innovations, (e.g. Arrighetti *et al.*, 2014) as their implementation does not require specific equipment. However, constant small investments are needed to familiarise the stakeholders with the particular tools and techniques (Papalexi *et al.*, 2015). By adopting those innovative approaches, therefore, stakeholders do not perceive the change as a threat, as it is achieved through applying a series of small adjustments (e.g. Burnes and Jackson, 2011; Papalexi, 2017).

Particularly, RL practices could facilitate the management of reverse components of the medicine delivery process, which would lead to a significant reduction in the level of wastage, preventing a negative impact on the society (Xie and Breen, 2014). Tran *et al.* (2014) stated that these products are produced in diverse forms and as a result, their cost and expiration dates vary. By implementing Reverse Supply Chain Management (RSCM) within the PSC, a minimisation of product waste and the associated cost could be achieved, which leads to a reduction in storage space and reduction of funds tied up in assets (Papalexi *et al.*, 2015; Chen *et al.*, 2019). As a result, healthcare organisations would be able to meet the request of reducing spending on pharmaceuticals

and increasing the quality of healthcare services by applying return policies. The data collected from this action could actively inform the supply and replenishment of medicines (Breen and Xie, 2015).

Unfortunately, the current delivery system applied in both selected contexts does not support such interventions. In particular, weak communication and limited knowledge and data exchange between the PSC stakeholders act as barriers to applying RL. It is suggested that the adoption of Lean approaches can overcome those obstacles, as these develop a continuous improvement roadmap, which requires the contribution of all actors of the supply chain (e.g. Hayes *et al.*, 2014; Govindan *et al.*, 2015; Papalexi *et al.*, 2020; Altug and Sahin, 2019). Interestingly, Timmons *et al.* (2014), who examined aspects of Lean within a healthcare environment, found that the level of engagement and enthusiasm was significantly higher, which indicates the acceptability of such interventions. In addition, Hayes *et al.* (2014) suggested that patients' satisfaction and trust regarding the occupational expertise can be increased within a Lean environment. The use of the Lean tools and techniques, such as Just-In-Time (JIT) approaches, promote standardised processes and facilitate the collection and sharing of relevant data (e.g. Gong *et al.*, 2014; Shafique *et al.*, 2019). Lean and RL approaches also need to be supported by Benchmarking and the application of it can be beneficial for healthcare organisations aiming to improve their performance, as Benchmarking provides information on how best innovative approaches can be implemented and results realised (Adebanjo *et al.*, 2010). The data analysis revealed a partial use of IT systems by pharmacies in both geographical areas; the need for compatible and integrated IT systems is apparent in order for the PSC stakeholders to be able to capture, store and manipulate the large volumes of data related to the use of pharmaceutical products (Feldman *et al.*, 2012; Raghupathi and Raghupathi, 2014).

Figure 5 presents the developed Innovative Pharmaceutical Supply Chain Framework (IPSCF). Particularly, the IPSCF suggests the adoption, development and implementation of Lean and Reverse Logistics (RL) practices, which are supported by integrated Information Technology (IT) systems, to optimise the medicines delivery process and improve the PSC's effectiveness and efficiency. The framework has the potential to act as guidance to pharmacies and healthcare

organisations, directing them to develop supply chains strategies according to which medicines waste reduction and the enhancement of service quality can be achieved.

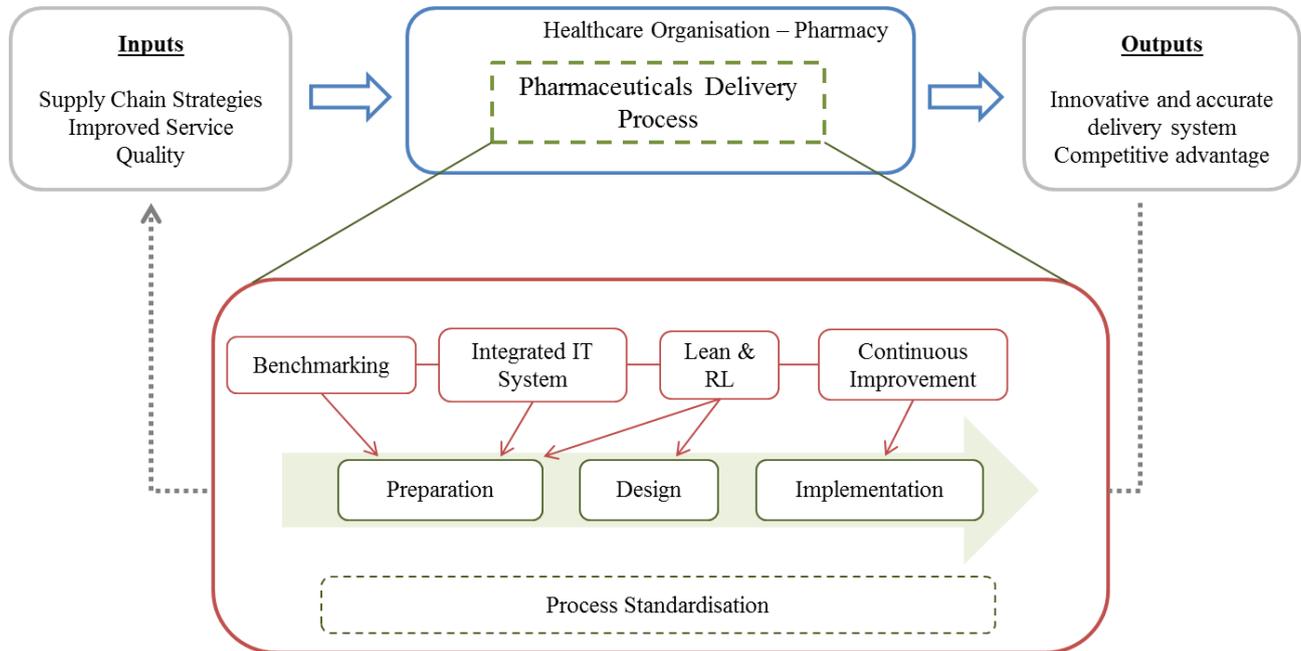

Figure 5: The Innovative Pharmaceutical Supply Chain Framework

Benchmarking can be used to collect relevant data and inform best practice and an integrated IT system utilised to speed up the delivery process. Perhaps more directly, and informed by this research, Lean and RL practices can be implemented to prepare and design an innovative, robust and accurate pharmaceutical delivery system, which leads toward continuous improvements (e.g. Arrighetti *et al.*, 2014; Shafique *et al.*, 2019). It supports the concept that by adopting best practices that have been successfully applied in a manufacturing setting, the delivery system can be enhanced in terms of quality (product and service quality), visibility (knowledge and information sharing), speed (response to customers’ and suppliers’ needs) and cost (minimisation of cost and waste). The IPSCF is tailored to the specific delivery practices undertaken within the downstream domain of the PSC in the two selected European contexts: the UK and Greece. However, it is believed that it can be adapted by the rest of the European countries as it has been apparent that the two study contexts operate similarly.

In addition, the benefits generated can be greater if the suggested framework is implemented throughout the PSC as a whole.

## 6. Conclusions

Although, studies exist which explore PSC management, those that adopt a focused approach on downstream PSC activity as a cross-case comparative analysis are limited. This study reviewed and extended knowledge in this area and thus offers an incremental and revelatory contribution (Nicholson et al., 2018). The main areas where this research has potential implications for supply chain theory and practice are the following:

- i) it adds a new dimension to the academic literature by investigating the subject of SCM, considering both hospitals and community pharmacies operating in the UK and Greece; it extends earlier work conducted by Bhakoo et al. (2012) on inventory management; Xie and Breen (2014) and Breen and Xie (2015) on waste management; and Burnes and Jackson (2011) on change management in healthcare. Furthermore, the focus of the study on country comparison answers the call for research suggested by Bravo and Carvalho (2015), who looked at optimisation of supply chains through return policies;
- ii) it contributes to the academic literature by exploring the downstream domain of the PSC that was been far more scarcely discussed than the upstream (e.g., Danese, 2006; Narayana *et al.*, 2014);
- iii) it identifies the factors that could influence innovation adoption within the healthcare organisations, which matches Westrick and Mount's (2009) recommendations for further research, arguing that a combination of improvement approaches, such as Lean, with computerised methods could be the basis for enhanced innovation uptake;
- iv) it addresses a critical issue for academics and practitioners, which is related to the challenge of how healthcare organisations could be more productive, whilst using fewer resources (e.g. Mustaffa and Potter, 2009; Xie and Breen, 2012; Al-Balushi *et al.*, 2014; Papalexi et al., 2019). This was

achieved by developing the Innovative Pharmaceutical Supply Chain Framework (IPSCF) (Figure 5), which suggests the implementation of Lean and Reverse Logistics (RL) practices for optimising the downstream domain of the PSC, using the available resources and capabilities. The IPSCF offers a new contribution to practice through providing a roadmap of how best healthcare organisations could adopt innovation to improve the medicine delivery systems without increasing their expenses. This conceptual model visualises the medicine delivery process, when Lean and RL are implemented. It uses the benefits provided from them which improve the transportation process, and presents the outputs that the organisations could claim. Although the recommended improvements are based on theoretical evidence, it is believed that they could overcome the identified issues and they would not disrupt current practices. Furthermore, those improvements could support healthcare organisations to meet their goal of becoming world class institutes by promoting a team-work environment, enhancing their operational efficiency, setting up processes for continuous improvement and eventually gaining an advantage over their perceived competitors.

The Covid-19 pandemic is a timely reminder that healthcare providers need to have well designed and effective systems to be resilient, responsive and innovative when faced with threats. Lack of access to critical equipment and medicines can be exacerbated by poor processes and systems that are not streamlined or transparent (Foster & Neville, 2020). Pharmacy staff can be provided with the necessary training to develop their skills in lean techniques to improve their processes and systems, identifying failure points and deficiencies, which can contribute to delays in dispensing, medication errors and patient dissatisfaction. The return of medicines from patients and safe disposal of medications takes place in both hospital and community pharmacy settings (in hospital from wards - and in community pharmacy from patients or their representative). As the cost attributed to waste medicines is high, staff can proactively address this through greater transparency of stock allocation/rotation and storage facilities to identify problematic stockpiling, obsolescence or incorrect practice e.g. leaving stock unrefrigerated rendering it non-viable. Community pharmacy staff can also promote advocacy by educating and encouraging patients to return unwanted medicines for safe

disposal. The race for the Covid-19 vaccine is now a priority for government bodies globally and the focus will then move to the vaccine supply chain. Innovative thinking informed by key practices such as Lean and RL, is much needed and timely to help design strategies to ensure that logistics into and within hospital/community pharmacies can support the robust supply chain needed for vaccine distribution (United Nations Environment Programme, 2020) and secure access to medicines in light of ongoing shortages (Hill, 2020).

The introduction of a RL system to encourage the return and recovery of medicines for further use or safe disposal and equipment e.g. medical devices, for refurbishment/repair, can save hospitals money but also make products more accessible for patients (e.g. returned to pharmacy stock from wards). Such innovation in the PSC is, from an economic, social and environmental perspective, an example of good practice. In a world with finite resources it is perhaps logical that staff should be encouraged to be innovative and work together to design such systems, and to ensure that stock is well managed using both manual and inventory management systems. The identification of Reverse Logistics and Lean Champions to lead staff to implement new and adapted systems could facilitate engagement and sustainability.

It should be noted that this paper, despite its theoretical and empirical merits, does have some limitations. One of the major challenges the authors faced conducting the current study was related to accessing data. Considering that professionals working within the PSC have a relatively heavy workload, a number of the potential participants were reluctant to be involved in this research. In addition to this, the study focuses only on the downstream domain of the PSC, which excludes those specialists operating within the upstream and central PSC domain. Moreover, some individuals were also excluded due to their limited knowledge of Operations Management (OM) and Supply Chain Management (SCM) practices. The authors acknowledge that the quantitative research findings, because of the limited total sample and the differences between the Greek and the UK settings and sample sizes, might not be easily generalisable or transferable to a broader context. It is recognised that the two-country sample used jointly may not be per se representative of a single population or a

whole sector. However, because of the systematic nature of the work that took place involving among others comparisons with similarly positioned studies from the relevant literature and combination with a qualitative analysis, the findings provide accurate indications of the innovation opportunities reflecting and affecting the downstream PSC. In addition to this, the lack of financial data available had an impact on the research's contribution to practice. Considering that the main emphasis of healthcare organisations has been placed on reducing their drug spending, it is believed that the collection of financial data would have added value to the current thesis.

This paper has stated potential implications for supply chain theory and practice, and while the research itself provides insights into the factors that might affect the pharmacies' innovativeness, concentrating on the whole PSC could add more information, based on which a more reliable research could be achieved. The theoretical perspective of this study generates also another avenue of future research, which would be to target and examine the performance of PSCs where innovative approaches, such as Lean and RL practices, have been considered and implemented. As the current study has been focused on the delivery practices applied within two European contexts, researchers are encouraged to investigate the aspects of the PSC adopted across European boundaries.

## Appendices

### Appendix 1: Survey instrument

Deployment of innovation within the PSC

Page 1: Welcome

I would like to invite you to take part in the study named above. Your response will contribute to a PhD project on deployment of innovative programmes within the Pharmaceutical Supply Chain.

Purpose of the survey: The purpose of this survey is to collect information about innovative programmes within the Pharmaceutical Supply Chain in the UK. There has been pressure on the NHS, and generally on healthcare organisations, to keep a tight rein on their drugs spending. The annual drugs bill in the UK is approximately £10 billion, which equates to about 10% of NHS expenditure, having risen 3.5% a year between 2007 and 2011 (McKee, 2012). Therefore, pharmacies tend to concentrate on innovative programmes to reduce waste and costs, while improving quality of services (Odier, 2010). Hence, the aim of the study is to explore the impact of innovation upon productivity and performance over the last five years.

Please respond to all questions (unless otherwise instructed) as this will allow comparisons to be made between respondents.

To encourage your participation in the survey a prize is being offered which is a 8.3" Tablet: Tesco hudl 2. The winner will be selected via a random computerised draw selection process which will be carried out the next working day after the relevant close date.

Definition of Innovation: Innovation, for the purpose of this survey, is defined as new or significantly improved products, services or processes used to produce or supply any products or services that the organisation delivers. The innovation (new or improved) must be new to the organisation, but it does not need to be new to the healthcare sector. Information Required: Section 1 - Innovation Activities; Section 2 - Context for Innovation; Section 3 - General Information.

I would be very interested to hear your experiences. Please help by filling in the relevant box; it should only take 10-15 minutes of your time. Your answers will be kept anonymous and strictly confidential. If you would like any further information or details of the study, please contact: Marina Papalexi via email: [M.papalexi@hud.ac.uk](mailto:M.papalexi@hud.ac.uk)

Thank you for your participation and support!

Note that responses are not saved until you have clicked on the CONTINUE button at the bottom of each page. You cannot return to review or amend a previous page.

Page 2: Section 1 - Innovation Activities

The following questions are related to changes in organisation strategy and practices over the last five years; investments in current and future innovation and the introduction of new or improved products, services and processes.

This part of the survey uses a table of questions, view as separate questions instead?

1. To what extent the pharmacy has invested in any of the following, for the purposes of current or future innovation:

	Strongly Disagree	Disagree	No Opinion	Agree	Strongly Agree
Acquisition of advanced machinery, equipment and software for innovation:	<input type="radio"/>				
Computer hardware	<input type="radio"/>				
Computer software	<input type="radio"/>				

This part of the survey uses a table of questions, view as separate questions instead?

2. For each of the main innovation related investments in question 2, please ESTIMATE the amount of expenditure. Where precise figures cannot be provided please give your best estimates

£(annually)					
0-5.000	5.000-10.000	10.000-15.000	15.000-20.000	More than 20.000	I do not know

<b>Acquisition of advanced machinery, equipment and software for innovation</b>	<input type="radio"/>					
<b>Training for innovative activities</b>	<input type="radio"/>					

This part of the survey uses a table of questions, view as separate questions instead?

14499754

3. To what extent the pharmacy has introduced

	<b>Strongly Disagree</b>	<b>Disagree</b>	<b>No Opinion</b>	<b>Agree</b>	<b>Strongly Agree</b>
<b>New or significantly improved products</b>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
<b>New or significantly improved services/processes for delivering products</b>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

This part of the survey uses a table of questions, view as separate questions instead?

4. Please ESTIMATE the percentage of the organisation's total turnover from products and services/process that were:

	<b>0%-10%</b>	<b>10%-20%</b>	<b>20%-30%</b>	<b>30%-40%</b>	<b>40%-50%</b>	<b>50%-60%</b>	<b>60%-70%</b>	<b>More than 70%</b>	<b>I do not know</b>
<b>New to your market</b>	<input type="radio"/>								
<b>Significantly improved</b>	<input type="radio"/>								
<b>Total turnover</b>	<input type="radio"/>								

This part of the survey uses a table of questions, view as separate questions instead?

5. To what extent the following factors were important in your decision to innovate in products, services or processes

	Not Important at All	Somewhat Important	Neutral	Important	Very Important
Improved flexibility of production or service provision	<input type="radio"/>				
Reduced time to respond to customer or supplier needs	<input type="radio"/>				
Improved staff communication	<input type="radio"/>				
Enhanced staff or patient satisfaction	<input type="radio"/>				

This part of the survey uses a table of questions, view as separate questions instead?

6. To what extent information from each of the following sources was important to your organisation's innovation activities

	Not Important at All	Somewhat Important	Neutral	Important	Very Important
Your organisation	<input type="radio"/>				
Suppliers of equipment, materials, services or software	<input type="radio"/>				
Patients or end users	<input type="radio"/>				
Government or public research institutes	<input type="radio"/>				

This part of the survey uses a table of questions, view as separate questions instead?

7. To what extent your organisations co-operated on any innovation activities with any of the following

	Strongly Disagree	Disagree	No Opinion	Agree	Strongly Agree
Other healthcare organisations	<input type="radio"/>				
Suppliers of equipment, materials, services or software	<input type="radio"/>				
Patients or end users	<input type="radio"/>				

This part of the survey uses a table of questions, view as separate questions instead?

8. To what extent the following factors were important in constraining innovation activities

	Not Important at All	Somewhat Important	Neutral	Important	Very Important
Excessive perceived economic risks	<input type="radio"/>				
Direct innovation costs too high	<input type="radio"/>				
Availability of finance	<input type="radio"/>				

Page 4: Section 3 - General Information regarding yourself

Finally, please answer the following questions related to yourself. This will allow the assessment of your organisation's environment. We would like to remind you that the survey is anonymous and the following data will only be used for conducting the investigation.

9. Please indicate your current residence

Greece

The UK

10. What is your job title?

11. What is your work experience with the organisation?

- 0-5 years
- 6-10 years
- 11-15 years
- 16-20 years
- More than 20 years

12. What is your highest level of educational qualification?

- High school
- College diploma
- Professional qualification
- Undergraduate degree
- Postgraduate Master's degree
- PhD

13. In the box below, please write any additional comments that you would like to make

Please submit your contact information below to enter to win the prize

14. E-mail address

More info

Page 5: Final Page

Thank you for completing this survey.
